July 30, 2012

The Honorable Denny Rehberg
Chairman
Subcommittee on Labor-HHS-Education
Committee on Appropriations
United States of House of Representatives
Washington, DC 20515

Dear Chairman Rehberg:

We the undersigned national organizations and research institutions are writing to express our concerns regarding several provisions in the Fiscal Year 2013 Labor, Health and Human Services and Education Appropriations Act that micromanages the National Institutes of Health (NIH) in addition to freezing its budget; thus limiting the agency’s ability to support the most promising, scientifically-driven research. Specifically, we are opposed to language in the bill that prohibits the NIH to use funds “for any economic research programs, projects or activities.”

As you know, the NIH mission is to support scientifically rigorous, peer-reviewed research, including basic and applied behavioral and social science research. Economic research, specifically research on the linkages between socioeconomic status and health outcomes in the elderly and achievement and health outcomes in children, has been an integral part of the interdisciplinary science NIH has supported historically. The agency’s investment has yielded key data, methodologies and substantive insights on some of the most important and pressing issues facing the U.S.

For example:

- NIH funded surveys such as the Health and Retirement Survey, the Panel Study of Income Dynamics, parts of the National Longitudinal Survey of Labor Market Experiences, and surveys on International Aging and retirement provide data necessary to monitor and detect changes in important socioeconomic trends in health.

- Economic modeling and methodologies and the longitudinal data from these surveys enable researchers to disentangle cause from effect and measure the relative significance of the different socioeconomic and environmental determinants of health related trends.

- Results of NIH funded economic research provide insights into important topics such as the functioning of the health care system, design and effects of health insurance and financing, diffusion of new health technologies, cost analysis and projections of health care, retirement date, savings, wealth accumulation and assets, and health-employment nexus and relationship.
NIH support of economics is also playing a key role in nurturing new fields of research such as the economics of aging, neuroeconomics and behavioral economics. Other agencies, including the Centers for Medicare and Medicaid Services, Social Security Administration, Centers for Disease Control and Prevention, and Administration on Aging, rely on the NIH to review, fund, and disseminate research findings that these agencies can translate into informed policy and programmatic decisions.

As the bill moves forward, we urge the Committee to reconsider the implications of this language and remove it from the final funding package whether the bill moves independently or is made part of a larger spending measure.

Thank you for your consideration of our views.

Sincerely,
